

About Us

Corporations today are under increasing legal and regulatory scrutiny to prove that they are providing 100% accurate accounting of their assets and liabilities. With the cost of software increasing relative to the cost of the hardware as well as the ease of distribution and access to software, many organizations may have legal liabilities that are completely unknown to the operating officers.

Agnitio Advisors was formed to assist corporations in ensuring that they have effective Software Asset Management compliance programs and policies in place in order to mitigate any legal or financial surprises. Employees of Agnitio Advisors have a wealth of knowledge in Software Asset Management based on their work with software manufacturers, tool providers, end-users and standards bodies. Our employees are also certified in multiple different Software Asset Management programs with an emphasis on ISO standard 19770-1 Information technology - Software asset management - Part 1: Processes. Our employees understand that you can use Microsoft Excel or you can use the most complete and capable Software Asset Management tool available on the market today, but if you don't have effective policies and procedures in place and a method that can be used to validate that your policies and procedures are working, your company is open to unknown legal and financial liabilities.
